**KANSAS CERTIFIED SEED
DIRECTORY** of producers of field
crops including wheat, spring oats,
triticale, rye, canola, and winter barley

Seeding Success Starts Here.

The BD7600 Box Drill from Great Plains is a truly revolutionary seeding solution.

The legendary BD7600 features industry-leading box capacity, a durable, field-tested design, and an innovative metering system for greater accuracy across most seed types, from traditional to cover crops. Add DrillCommand® and hydraulic drive to execute variable-rate and prescription mapped seeding effortlessly from the tractor cab.

Visit your local dealer or GreatPlainsAg.com to learn more.

Easy-to-transport Models Range in Working Widths from 26' to 50'

SEEDING FLEXIBILITY

PRECISE PLACEMENT FROM PRIMARY TO COVER CROPS

Many producers are making the switch to linear box affordability with the versatility to accurately plant high yielding primary crops as well as cover crops that produce valuable nitrogen and protect against soil erosion. Cover crops require the same seeding accuracy and depth control as primary crops. Achieving this requires the accuracy of the exclusive Fluted Seed Meter and the industry's first Pneumatic Down Pressure opener system. From 10' through 50' widths, the ruggedly built Landoll 5000 Series Drills deliver linear box affordability with unmatched standability.

Cover crops sequester carbons from the atmosphere and place them in your soils as valuable nutrients for your primary crop.

2023 WHEAT CROP REVIEW

Weather and Crop Development

Fall growing conditions

The 2023 winter wheat crop in Kansas had a rough start to the season due to a number of factors. First, it was following a previous drought-stress wheat crop (during the 2022 season), which was followed by a very dry summer as well. This resulted in very small – if any – soil available water in the profile at sowing for the majority of the state. Further, the month of September 2022 had very limited precipitation (less than 2 inches for the majority of the state), and whatever precipitation occurred, came in fairly early for the majority of the Kansas crop. This precipitation mostly occurred before September 15 for the majority of the state, and such precipitation never occurred in the southwest corner of the state.

With topsoil moisture available in parts of the state, growers planted wheat fields fairly early to ensure good emergence and a decent stand establishment in the fall. However, the remainder of the fall was dry, with precipitation totals between mid-September to mid-January of mostly less than 3.5 inches for the majority of the wheat growing region (in fact, in most cases less than 1 inch in southwest Kansas). The conditions above had two main consequences: 1) Fields planted in September emerged and established during the fall; fields planted during October did not emerge until sometime in November for central Kansas; and 2) in many cases, did not emerge until sometime in the spring in western Kansas. There were also a number of fields planted in October where planting into moisture was hit-or-miss, which showed very poor and scattered stand establishment going into the winter.

Winter growing conditions

The winter was mostly cold and dry. During an entire week in late December, temperatures dropped well into negative values, which, combined with the drought, led to widespread winterkill damage in north central Kansas – in particular in the region between Solomon and Phillipsburg. Departure from temperatures during January to March were about 0-5°F below average in western Kansas, and 0-1°F above average in central Kansas. Dry conditions expanded from southwest, to the entirety of western Kansas and into the central part of the state, as the majority of the crop received less than two inches of precipitation during the winter.

Early spring growing conditions

The drought conditions persisted in the spring until early to mid-May, depending on the part of the state. The spring started with two severe freeze events during the last week in April, the first event with temperatures reaching as low as about 17°F, and the second with temperatures as low as about 24°F. As the majority of the wheat in central and

south central Kansas were already going through stem elongation to heading, these freezing temperatures caused a number of fields in central Kansas to show symptoms of freeze damage. Subsequently, a hot-dry-windy event took place in early May, which resulted in as many as 18 hours of cumulative temperatures above 82°F in southwest, central, and northeast Kansas. Many fields in this region showed symptoms of heat damage, such as a very uniform scorching of the top third of the wheat heads in the field.

The combination of a season-long drought stress, severely cold conditions during the winter, two freeze events during early spring and a subsequent short period of extreme heat stress in early May resulted in extremely poor wheat conditions across the majority of the state. By mid-May, fields in central Kansas (east of a line from Smith to Pratt counties) showing mild symptoms of drought stress such as younger leaves curled, abortion of older leaves, and yellowing of lower canopy; whereas fields west of this line were showing symptoms of extreme drought stress, such as extremely reduced plant height and biomass, and a delayed development that accelerated through the flowering period due to the heat stress. Many of the fields across the state were into the reproductive stages of development (flowering and grain elongation) only measuring 9-12 inches tall due to the prolonged stress. This led to a widespread crop abandonment in many regions of the state.

From a regional perspective, the worst crop conditions occurred in far southwest Kansas, where many times the wheat did not emerge until sometime in May and led to crop termination. Severely drought stress crops with very large area abandonment occurred from the southwest corner of the state as far east as Pratt County and as far north as Wichita County. Area abandonment also occurred in the north central part of the state (from Solomon to Norton), due to the combination of drought stress and winterkill. From a cropping systems perspective, the extreme drought caused large differences on the yield potential of the wheat crop as function of previous crop and the presence of a fallow period.

In central Kansas, wheat fields planted after a previous wheat or canola crops were showing much better yield potential than wheat fields planted continuously after a soybean crop – which in many cases was abandoned. These differences were even more apparent in the western portion of the state, where wheat planted after a long-term fallow period may have had a 30-40 bushel per acre yield potential, as compared to a 10-15 bushel per acre yield potential in continuous wheat (3-month fallow), versus a failed crop on wheat after corn (no fallow).

Grain filling period

Starting during mid-May, the departure from average precipitation became positive and the departure from average temperature became negative. A total of up to 6 inches of precipitation accumulated in this period, and temperatures were as many as 6°F below average – especially in late May and into early June. Combined, precipitation and temperature regimes after the initial heat stress of early-May were near ideal for grain yield development, ensuring some grain production despite an already limited yield potential due to the season-long drought stress. This meant that the majority of the grain filling period for wheat had cool and wet conditions. For most the wheat crop around the state, these conditions made the difference between full crop abandonment or harvesting an average crop. (Romulo Lollato, Kansas State University Extension Wheat Specialist; and Chip Redmond, Kansas State University Mesonet Manager)

Diseases

In the 2022-23 growing season, wheat yield losses to disease were below historical averages. Unseasonably dry conditions through April delayed the first detection of stripe rust in Kansas until the first week of May, when trace level of stripe rust was detected on irrigated wheat in Edwards County. Cool, wet conditions in late May and early June led to establishment of stripe rust in 27 counties total by the end of the season with high incidence and severity only noted in west-central and northwestern counties.

Leaf rust was observed in multiple locations but developed late in the season and did not result in notable yield losses.

Wheat stem rust was first detected on the susceptible varieties on June 2 in Lane and Thomas counties. After ten days, stem rust incidence at Thomas County had increased to approximately 3% and was easy to find. By mid-June, low to moderate stem rust incidence was observed on susceptible varieties in Republic, Wallace, Riley, Jewell, and Decatur counties located in the north central, western, and northwest regions. The late onset of stem rust likely mitigated yield loss, although highly susceptible varieties in the most north west counties of the state may have seen a yield impact.

Wheat streak mosaic and related viruses were detected in central and western Kansas but levels were generally low. Barley yellow dwarf virus was also present statewide but levels were low. Fusarium head blight (head scab) was a notable problem in northwest Kansas, with reports of discounts and rejections due to high levels of the mycotoxin deoxynivalenol (DON, vomitoxin). These unusually high levels were likely due to highly favorable conditions (high moisture and relative humidity) in that part of the state during the end of May which coincided with the flowering window of the wheat crop.

(Kelsey Andersen, Kansas State University Wheat and Forages Specialist)

Insects

Fall wheat planting went relatively well throughout much of the state, mainly because there were very few delays due to rain. These dry conditions also led to some spotty germination, which caused more concern about the effect insect and mite pests were having rather than what they were actually causing. However, dry conditions, plus army cutworm infestations, in both late fall and early spring in many areas especially in south and northcentral Kansas, did cause thin stands. Many of these fields that were stressed for moisture then had chinch bug infestations in the spring, which added even more stress to the plants.

Army cutworms and chinch bugs, combined with less than ideal growing conditions, resulted in many fields with reduced stands, or fields that were deemed not worth harvesting and were ultimately plowed under to make ready to plant a spring crop. (Jeff Whitworth, Kansas State University Department of Entomology)

Harvest Statistics

The Kansas Agricultural Statistics' July estimate of the 2023 crop was 208 million bushels from 6.50 million acres, down 2% from last year's crop. Yield per harvested acre is expected to average 32 bushels per acre, down 5 bushels from last year's final yield. (July 2023, *Crops Report*, Kansas Agricultural Statistics)

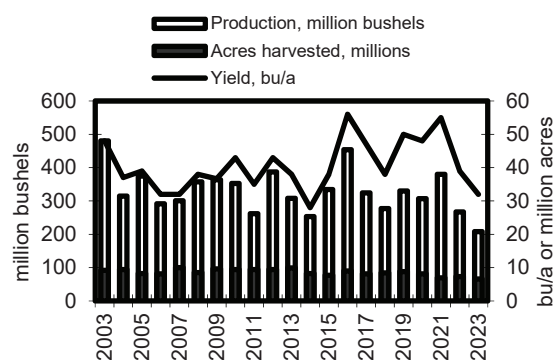

Figure 1. Historical Kansas wheat production

SY Monument remained the top-seeded variety in Kansas for the fifth consecutive year, accounting for 6.6% of the state's planted acres. Bob Dole ranked second at 4.6%. SY Wolverine ranked third at 4.1%, and WB-Grainfield dropped to the fourth place at 3.9%. Winterhawk rounded out the top 5 with 3.8% of the seeded acreage in Kansas. (March 2023, *Kansas Wheat Varieties*, Kansas Agricultural Statistics)

Acreeage Distribution

2023 PERFORMANCE TESTS

The Kansas Agricultural Experiment Station annually compares both new and currently grown varieties in the state’s major crop-producing areas. These performance tests generate unbiased performance information designed to help Kansas growers select wheat varieties suited for their area and conditions.

One-year or one-location results can be misleading because of the possibility of unusual weather or pest conditions. **Be sure to keep extenuating environmental conditions in mind when examining test results.** For more information please visit: agronomy.k-state.edu/outreach-and-services/crop-performance-tests.

Varieties

Public varieties are selected for inclusion in the tests on the basis of several criteria. Most represent new or established varieties from Oklahoma, Texas, and Colorado with potential for successful use in Kansas. Some are included as long-term checks. Others are entered at the request of the originating institution.

Originators or marketers enter privately developed varieties voluntarily. Entrants choose both the entries and test sites. The 2023 entrants are listed in Table 1.

Results and Variety Characterization

Results from Kansas tests are presented in Tables 3 through 9. Yields are reported as bushels per acre (60 lb/bu) and are adjusted to a moisture content of 13% where moistures were reported at harvest. Yields also are converted to percentages of the test average to speed recognition of the highest-yielding entries. Multi-year averages are presented for those varieties entered more than 1 year.

Additional information such as test weight, heading date, and plant height is helpful for fine-tuning variety comparisons. Planting varieties with a range of maturities helps minimize weather risks.

At the bottom of each table is the (0.05) least significant difference (LSD) for each column of replicated data. One can think of the LSD as a “margin of error” that shows how big the difference between two varieties must be for one to be 95% confident that the difference is real. The use of the LSD is intended to reduce the chance of overemphasizing small differences. Small variations in soil structure, fertility, water-holding characteristics, and other test-site characteristics can cause considerable yield variation among plots of one variety.

Electronic Access

To access crop performance testing information electronically, visit the website at: agronomy.k-state.edu/outreach-and-services/crop-performance-tests

Research and Duplication Policy

When companies submit entries, permission is given to Kansas State University to test varieties and/or hybrids designated on the entry forms in the manner indicated in the test announcements. Seed submitted for testing should be a true sample of the seed being offered for sale.

All results from Kansas Crop Performance Tests belong to the University and the public and shall be controlled by the University to produce the greatest benefit to the public. Performance data may be used in the following ways: 1) Tables may be reproduced in their entirety, provided the source is referenced and data are not manipulated or reinterpreted; and 2) advertising statements by an individual company about the performance of its entries may be made as long as they are accurate statements about the data as published, with no reference to other companies’ names or cultivars. In both cases, the following must be included with the reprint or ad citing the appropriate publication number and title: “See the official Kansas State University Agricultural Experiment Station and Cooperative Extension Service Report of Progress 1179 ‘2023 Kansas Performance Tests with Winter Wheat Varieties,’ or the Kansas Crop Performance Test website, agronomy.k-state.edu/outreach-and-services/crop-performance-tests for details. Endorsement or recommendation by Kansas State University is not implied.”

Excerpts from the
University Research Policy Agreement with Cooperating Seed Companies

Permission is hereby given to Kansas State University (KSU) to test varieties and/or hybrids designated on the attached entry forms in the manner indicated in the test announcements. I certify that seed submitted for testing is a true sample of the seed being offered for sale.

I understand that all results from Kansas Crop Performance Tests belong to the University and the public and shall be controlled by the University so as to produce the greatest benefit to the public. Performance data may be used in the following ways: 1) Tables may be reproduced in their entirety provided the source is referenced and data are not manipulated or reinterpreted; 2) Advertising statements by an individual company about the performance of its entries may be made as long as they are accurate statements about the data as published, with no reference to other companies' names or cultivars. In both cases, the following must be included with the reprint or ad citing the appropriate publication number and title: "See the official Kansas State University Agricultural Experiment Station and Cooperative Extension Service Report of Progress 1179, '2023 Kansas Performance Tests with Winter Wheat Varieties,' or the Kansas Crop Performance Test website, agronomy.k-state.edu/outreach-and-services/crop-performance-tests, for details. Endorsement or recommendation by Kansas State University is not implied."

About this Directory

The seed producers listed in this directory have applied to the Kansas Crop Improvement Association (KCIA) for inspection of seed production fields. KCIA checks all seed sources to confirm seed eligibility.

Seed produced on these fields is not Certified or Quality Assured until the field has passed inspection and the harvested seed has been properly conditioned, sampled and tested.

Seed meeting certification standards is issued a Certificate of Inspection and may be sold as Certified Seed. Quality Assured seed must meet similar standards.

Kansas Seed Law requires all seed to be properly labeled. The label is your warranty. Each bag of Kansas Certified Seed must be labeled with an official KCIA certification tag.

A completed KCIA Bulk Retail Sale Certificate or Bulk Invoice Label must accompany each bulk sale. Contact KCIA regarding the specific rules for re-selling bulk Certified Seed.

KCIA does not produce, process, buy or sell seed; therefore, assumes no financial responsibility regarding any seed listed herein.

Growers guarantee that Foundation, Registered, Certified or Quality Assured seed sold by them conforms to the standards of the Association in origin, varietal purity and quality. KCIA should be advised of any complaints made to the producer or vendor of seed.

Listing of a producer does not imply that all requirements have been met at time of publishing. Contact KCIA if you have concerns or questions about seed offered as Certified or KCIA Quality Assured.

Plant Variety Protection

The Plant Variety Protection Act (PVPA) makes it possible to protect plant varieties by law. Therefore, it is unlawful to sell, offer for sale or expose for sale, uncertified seed by variety name when it is a variety for which a Certificate of Plant Protection has been issued, specifying sale only as a class of certified seed.

It is the responsibility of the grower to inform the purchaser that a variety is protected and at what level. This may be accomplished on the label by the appropriate statements. The status of varieties listed in this directory is as follows:

PVP Status* – Small Grains **As of July 21, 2023

*Important:

- Additional licensing and/or marketing restrictions may apply.
- New varieties with a PVP Level 0, 1, 2, or 3 may be updated to a different level in the future.
- List does not include all varieties found in the marketplace. For varieties not listed or status updates please contact the genetics provider or the KCIA office.

Kansas, Put a Good Coat On Your Winter Wheat

Defend against drought stress
and strengthen vital nutrient uptake
with proven biological products

**biotinsic® W13**

Improve drought tolerance
by optimizing root growth
and increasing water uptake

biotinsic® WN29

Increase nutrient uptake in
stressful conditions, and save
an average 17 lb/a of Nitrogen

"We tested Indigo's biological treatment on 300 acres of wheat to start. It was a night and day difference. 10 bu/a more than our untreated fields. It even bumped up our variety's protein content, which netted us a 37 cent premium. Next year, guess what we did? Put that seed treatment on all our wheat, and row crop acres too."

Jon Johnson, Kansas Farmer

Ag Spray Equipment, Unparalleled Fluid Transportation Trailers

When it comes to transporting fluids with utmost convenience, Ag Spray Equipment offers two exceptional trailer styles that surpass all expectations. Our standard Ag trailer and the cutting-edge DOT certified nurse trailer are designed to meet the diverse needs of our customers, ensuring fluid transportation anywhere it's needed.

The standard Ag trailer embodies the essence of a fluid transportation trailer, equipped with reliable implement tires. Primarily serving the agricultural market, these trailers boast a rugged design that can withstand even the harshest conditions. As the ag and fluid transportation industry evolves, there is an increasing demand for trailers that can safely cover longer distances while adhering to enhanced safety standards.

Ag Spray Equipment's DOT certified nurse trailers are crafted to not only meet but exceed all federal DOT standards. With advanced features like LED lights and electric brakes, these trailers guarantee the secure transport of fluids on roads and highways. Our DOT certified trailers come complete with a 2 5/16's adjustable height ball coupler, fenders, and high-speed highway tires, ensuring

optimal performance. With tank sizes ranging from 525 to 1610 gallons, each unit's plumbing can be tailored to fit the unique requirements of every customer, commonly available in 2 or 3-inch sizes.

To safeguard durability, each trailer boasts a heavy-duty frame protected by a high-quality powder coat paint. Furthermore, the steel frame is backed by an impressive five-year warranty, assuring our customers of its superior quality. For those in need of larger capacities, our trailers ranging from 1010 gallons to 1610 gallons can be customized with a 5-foot extended frame, providing a spacious 4-foot platform complete with a removable side rail. This versatile platform can accommodate various items, from 275-gallon chemical totes to inductor tanks and hose reels.

At Ag Spray Equipment, we take pride in being the industry leader in liquid handling equipment. For more detailed information, we encourage you to reach out to your local Ag Spray Equipment location or authorized dealer. Experience the pinnacle of fluid transportation trailers with Ag Spray Equipment, where excellence is our standard.

LCS is the CoAXium® leader, with more CoAXium varieties available and acres planted than anyone in the market.

**LCS Photon AX**

Ideal grazer. Strong test weight and protein. Performs well in dryland conditions.

**LCS Atomic AX**

Early with quick emergence, strong straw, reliable yields. Great for grazing and low pH.

**LCS Helix AX**

Intensive management chasing top-end yields. Excellent disease package.

**LCS Steel AX**

Latest maturing CoAXium with strong straw and standability. Excellent for grazing.

Ask for CoAXium wheat

HIGHER YIELDS START WITH HIGHER QUALITY SEED

- High Yield Record - 80 to 100 bushels
- Good Fall Forage Potential
- Good Stripe Rust Resistance
- Outstanding Mill and Bake Quality
- Good Aluminum Tolerance

- Excellent Leaf and Stripe Rust Tolerance
- Good Fall Forage Potential
- Good Straw Strength
- Excellent Soil Borne Mosaic Tolerance
- Good Grazing in Southern/Eastern KS

The combination of the air screen cleaner, length grader, gravity table, color sorter and magnets removes impurities, including white caps, that can plug air seeders and reduce yield.
